LedgerPilot

An AI finance copilot for small-business owners

It watches the cash, flags trouble early, and finds the right financing — and it never acts without your yes.

Topic E · SME Finance Copilot

WeBank FinTechathon 2026 · International Track

"AI as a Financial Participant"

Small businesses fly blind on money

The owner is the CEO, the salesperson, and the accountant — so the finance job gets done last, if at all.

Cash crunches arrive unannounced

Money looks fine until payroll week. By the time the gap is obvious, the options are bad and expensive.

Financing is a guessing game

Dozens of loan types, opaque terms. Owners pick what a relative suggested, not what fits — and overpay.

No one is reading the numbers

Margins slip and costs creep with no analyst watching. The trend is only clear once it has already hurt.

63M+ MSMEs in India alone — most without a single finance hire.

One copilot, three jobs

LedgerPilot is an agent, not a chatbot: it decides which tools to run, executes them, and can take action — with a human in the loop.

01

Cash-flow management with alerts

Reconstructs monthly cash flow, projects the next 30 days, and speaks up early — shortfall risk, thin buffer, expense spikes, overdue invoices.

02

Financing-option matching

Matches the business to the right instrument with an explainable fit score, estimated cost, and the reasons behind every pick — and why some are off the table.

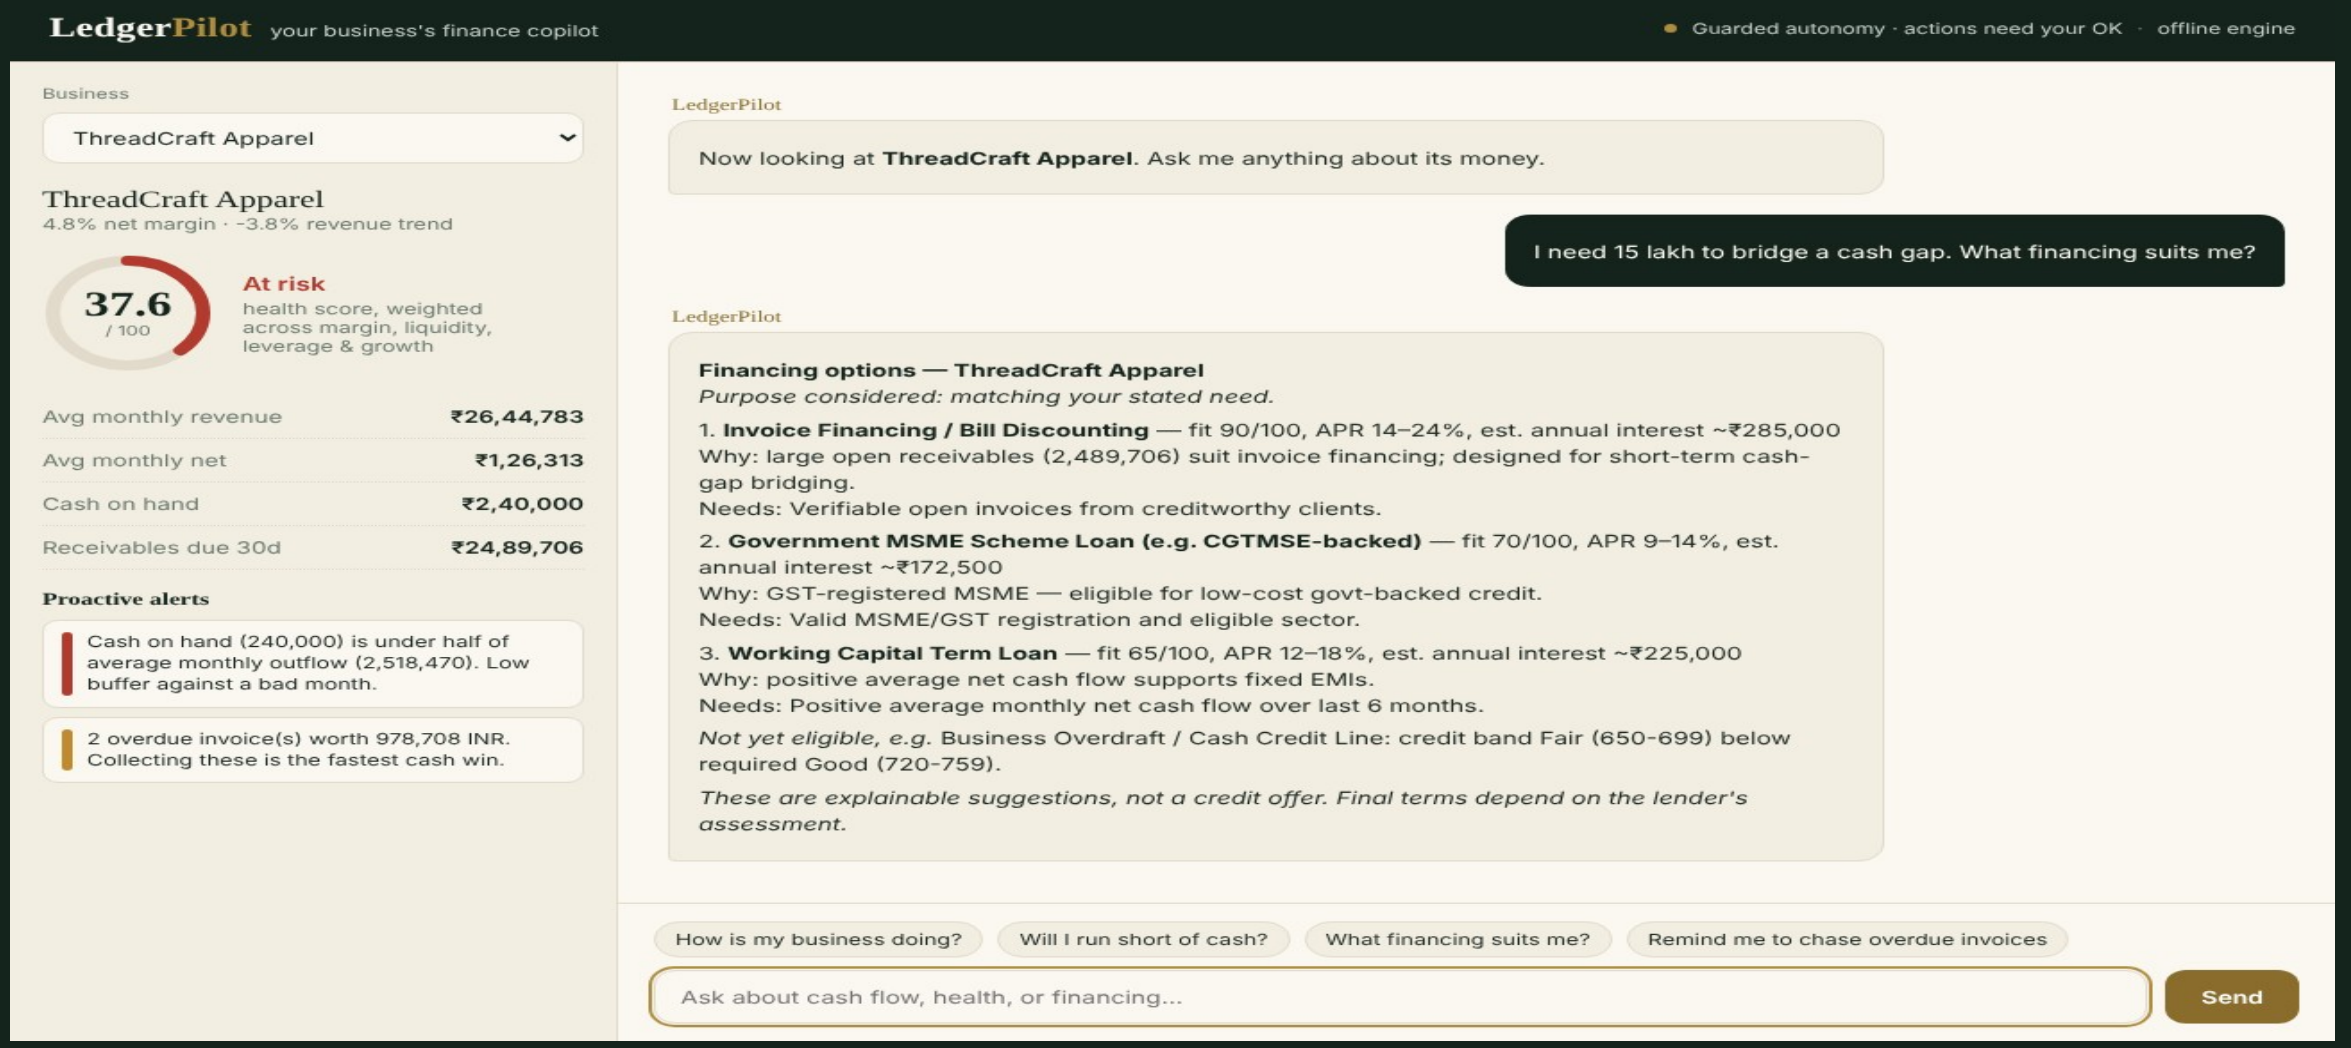

03

Business financial analysis

Computes margin, leverage, trend and cost drivers into one explainable 0–100 health score you can actually act on.

The product, working today

A live snapshot of the business on the left; a copilot you just talk to on the right.

It warns you before the gap, not after

Cash-flow engine · proactive alerting

How it works

- Buckets 6 months of transactions into monthly inflow / outflow and net
- Runway = cash ÷ monthly burn; flagged red under 3 months
- Expense-spike detection: a category beyond 2σ of its own history
- 30-day projection with a conservative half-collection on near invoices

Live example — ThreadCraft Apparel

Profitable on paper, but cash-starved by 60–90 day client terms.

HIGH

Cash on hand ₹2.4L is under half of average monthly outflow (₹25.2L). Thin buffer against a bad month.

MED

2 overdue invoices worth ₹9.8L — collecting these is the fastest cash win.

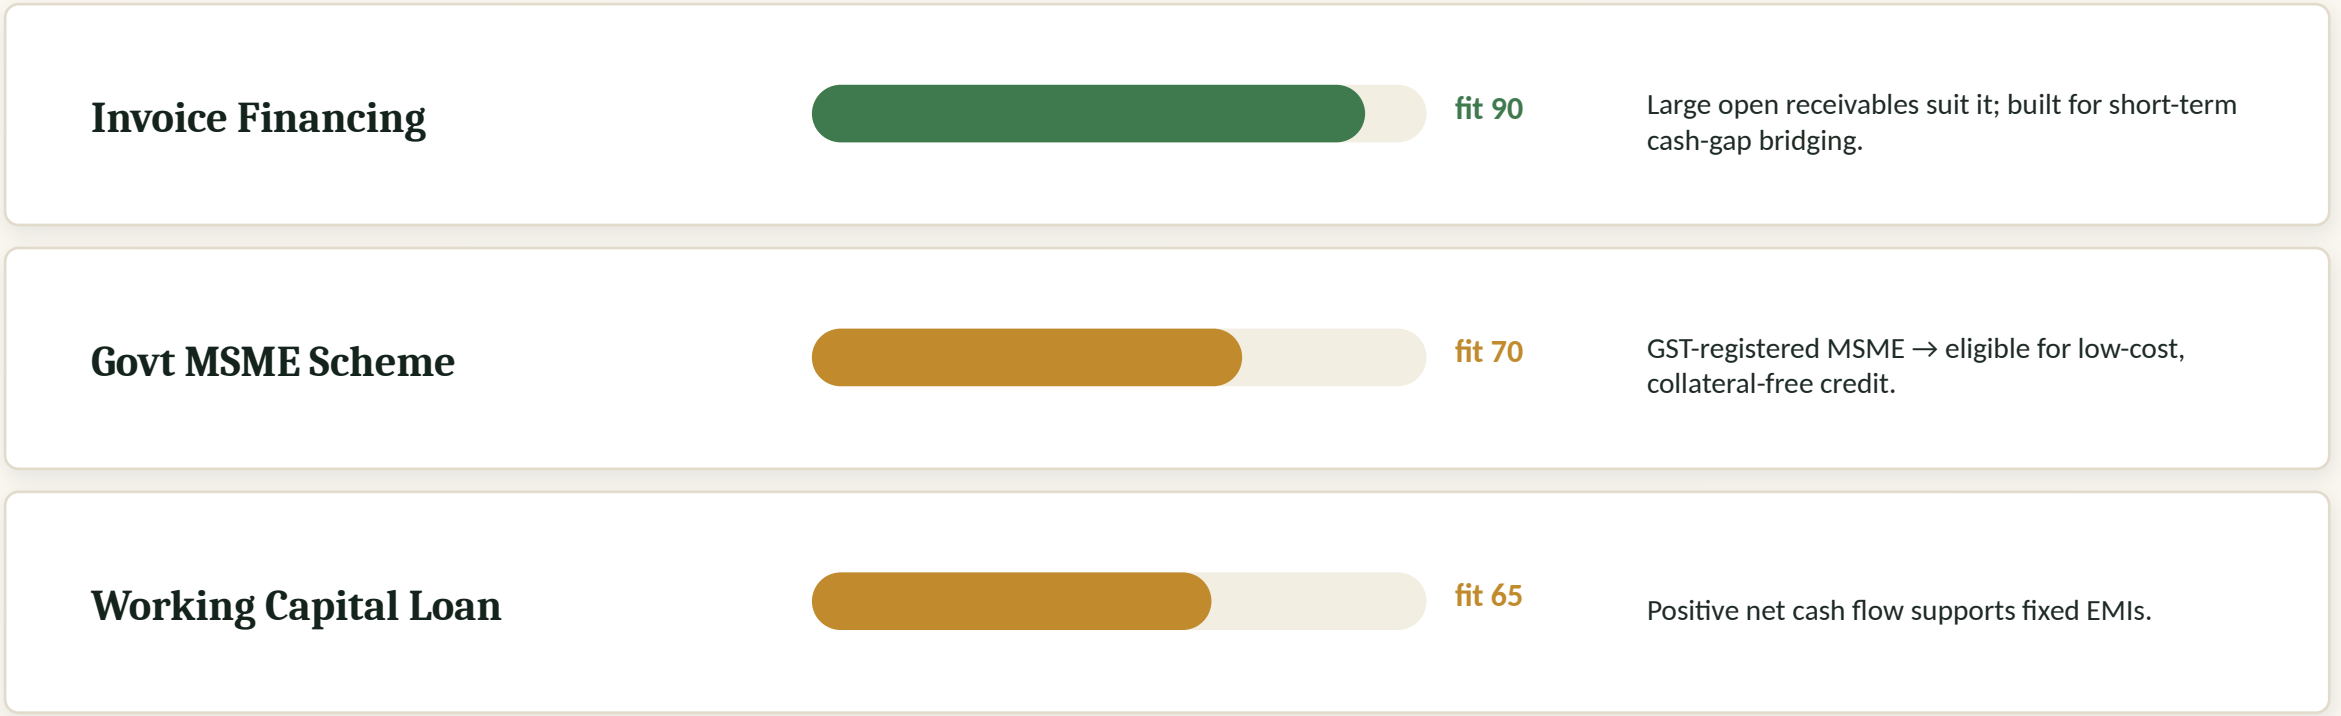

MED

Raw-materials spend last month ran well above its usual range.

The right financing, with the reasons

Explainable matcher · 6 product types · eligibility + fit scoring

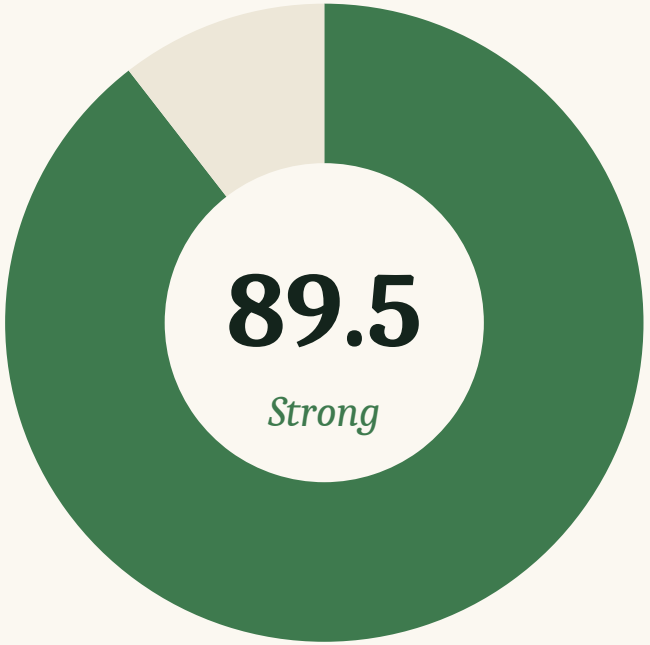

Ask: "I need ₹15 lakh to bridge a cash gap." LedgerPilot ranks what actually fits — and shows its work.

Every reply ends: "explainable suggestions, not a credit offer." Transparency is the compliance feature.

A health score that shows its math

Financial analysis · explainable 0–100 score

PixelForge Studios

Four weighted components — each defensible

Margin	30%	25% net margin → 100
Liquidity	25%	2 months of cash → 100
Leverage	25%	debt-free → 100
Growth	20%	flat revenue → 50

The score returns its components and weights — so an owner (or an auditor) sees exactly why.

How it works under the hood

A four-stage agent loop over typed tools, with every step logged.

Plan → **Permission gate** → **Execute** → **Narrate**

analyze_cashflow	financial_analysis	match_financing	schedule_action
T0 · read	T0 · read	T1 · recommend	T2 · act

Read-only datastore

3 sample SMEs · 6 months of transactions · invoices · financing catalog. One seam to swap in live accounting/bank data.

Dual LLM backend

Any OpenAI-compatible API for the live demo; a deterministic offline engine runs the whole loop with no key — reproducible evidence.

Security is the design, not a wrapper

30% of the score — and the hardest thing to retrofit

T0

Read-only analysis

No side effects. Always allowed.

T1

Recommend / draft

No side effects. Allowed up to the ceiling.

T2

State-changing action

Always needs explicit confirmation — the agent never self-approves.

Confirmation-always

Every money-adjacent action stops for a human yes. Proven live in three cases.

Full audit trail

Every message, plan, tool call, result and denial is logged to JSONL.

Explainable & non-advice

Reasons on every recommendation; a clear not-a-credit-offer disclaimer.

No hallucinated numbers

All figures come from deterministic tools, never the model.

Built straight to the rubric

40%

Task completion

All three capabilities implemented with real financial logic and verified end-to-end.

30%

Security & compliance

3-tier permissions, confirmation-always, full audit log, explainable non-advice.

30%

Innovation & interaction

Live snapshot panel, proactive alerts, purpose-aware matching, pluggable offline/live engine.

Plus: runs today with no setup, 12 passing tests, and reproducible execution evidence in the repo.

What's real, and what's sandbox

We're upfront about the line — judges value that.

Real and working

- ✓ The full agent loop — plan, gate, execute, narrate
- ✓ All three capabilities with genuine financial logic
- ✓ The permission system — all three cases proven live
- ✓ Complete audit log + actions ledger as evidence
- ✓ 12 automated tests, all passing
- ✓ Web app + offline engine, runnable with no key

Simulated for the sandbox

- ○ SME data stands in for live accounting/bank feeds
- ○ Financing catalog is representative; APRs are ranges
- ○ Actions write to a ledger instead of firing real alerts
- ○ No real account, customer, or money is ever touched

Where this goes next

1

Connect

Live accounting & bank connectors (Tally, Zoho, account aggregator) replacing the sandbox.

2

Quote

Lender-API integration for real, binding financing quotes instead of indicative ranges.

3

Guard

Input-policy layer in front of the planner; per-field data scoping for tighter privacy.

4

Reach

Multi-currency for cross-border SMEs; background alerts that reach the owner between sessions.

LedgerPilot

The finance teammate every small business deserves.

Thank you — questions welcome.
